

[day-8] Docker Introduction.

①

* Physical Server

800GB (RAM) [Not needed by Tomcat 2GB RAM, java + total could be 100GB]
32 CPUs
1000GB (HD)

Enterprise

- ↳ one Appli. ↔ One Server (wasting Resources there)
- ↳ Disk speed, HD measurement NOT possible Before. (Physical Server)

* [Virtualization]

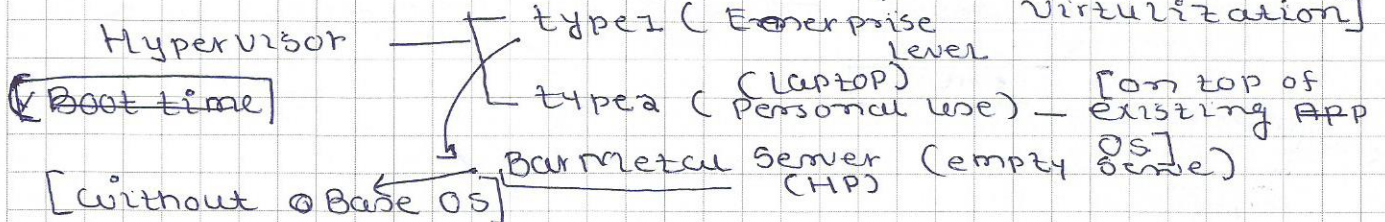

→ [Hardware Virtualization] [Hardware divide]
100GB RAM,

- own IP, own Hardware - [each machine → each WIN]

Oracle VM virtualBox manager
Ubuntu - 3.5TB RAM
20 GB.

→ VirtualBox (Software called Hypervisor to enable Virtualization)

→ Hardware Level Virtualization (own OS, own resources on Hardware level)

[wait after Boot]

→ OS maintenance - Patching OS, OS version (decommission)
[along APP, keep applying Patch]

↳ [Dynamic Allocation] Application

- 100gb assign to windows App. [Need more memory]
- dynamically not possible (Need to do manually)

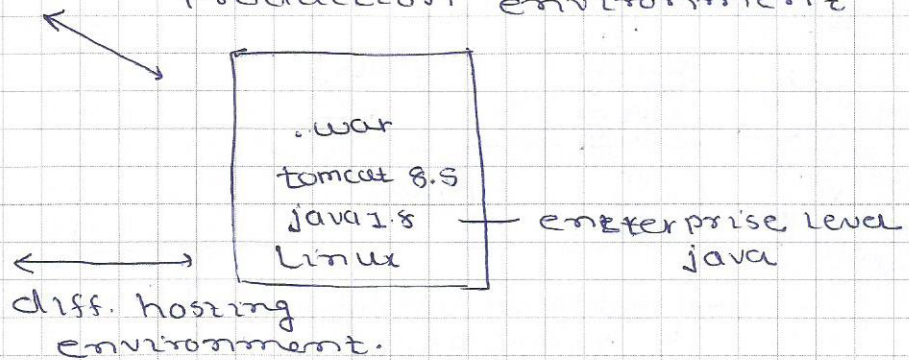

* - Scalability - increasing Capacity.
 [Amazon app.] → more capacity.
 → number of windows or new VM

- Request to of D.M before 3-months.
 - install OS (Ubuntu, window)
 - middlewar.
 - deploying App.

- take more time to scale up.
- challenge of high available. (test server) (need more test) Before

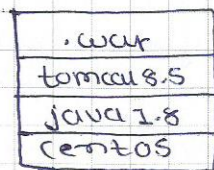

APP works locally But Not in Production environment

* Devops (collaboration with Dev)
 - prepare common environment

1000 production
 1000 OS machine
 1000 java
 1000 Deployment

← test APP here.

(ReadyNet)

[put same snapshot on production. [with include everything]]

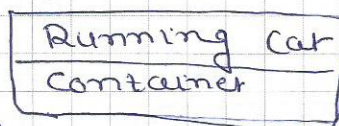

Snapshot called image. (APP. - (sleeping mode)
 Run time formate of image container] ←

→ tomcate Container Running

(dynamic) [container]

stop engine state

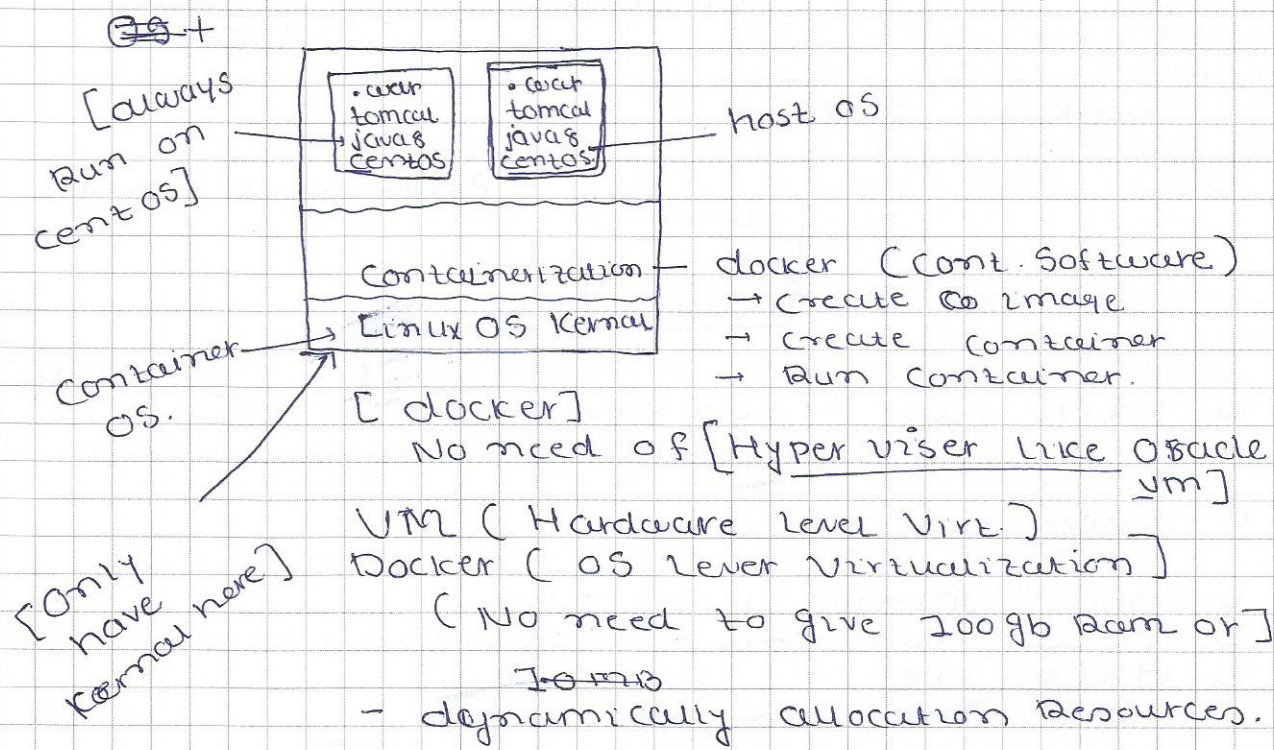

engine started

[capability to response to user request]

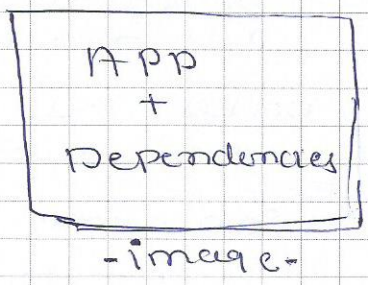

* How to Run Container? (OS Required, Linux OS) ^{pref.}

- Containerization Software - allows to Run Container

→ Light weight OS - (must be light weight OS)

- CentOS, { Ubuntu } Suse
- ↓
- ↳ ps command
- ↳ vim editor
- ↳ many feature.

→ OS with 5.6 mb ~~of~~ available (No have kernel)

→ Kernel - main Problem (

→ Start app quickly in 2 second (boot time issue)

→ more Container available from image (2-second)

→ Create an image → Run as container

- NO Config issue
- NO env. issue

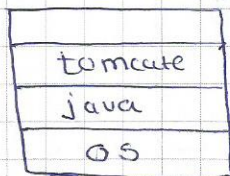

- Prod
- dev.

* hub-docker - pre-build image - tomcate
 - CentOS image
 - Suse Linux
 - Apache
 - Nginx

(Officially Organized created)

tomcate image

Prep-build images.

↳ Docker pull leaddevops/petclinic:37 (version number)
 ↳ by default connect to docker hub.

↳ Docker images

↳ Docker history image-name

↳ Docker run -d -P leaddevops/petclinic:37

↳ docker exec -it id -
 cat /etc/passwd

↳ docker ps

↳ docker run -d -p nginx ↙ web server container
 - unable to find locally
 pull from hub.

↳ Docker pull alpine

alpine → 5.6 MB (lightweight)

Container as service

one

→ Docker Volume → host machine.
 ↑ data storage.

→ Docker-Swarm (cluster level)
 functionality.
